

Notes

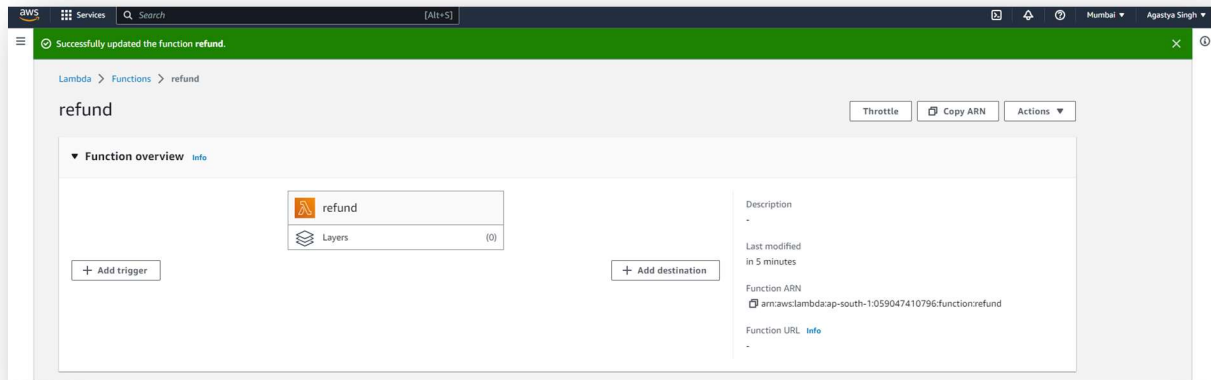

AWS Step Function

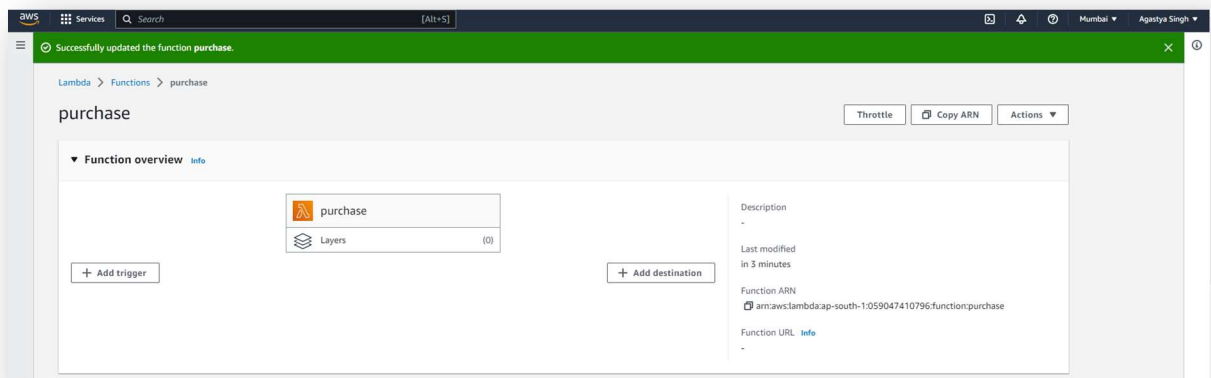

Refund Lambda

1. Create a lambda function named Refund.
2. Edit its code (python code) and change it to the one mentioned in the file (refundProcess.py) and appendix below.

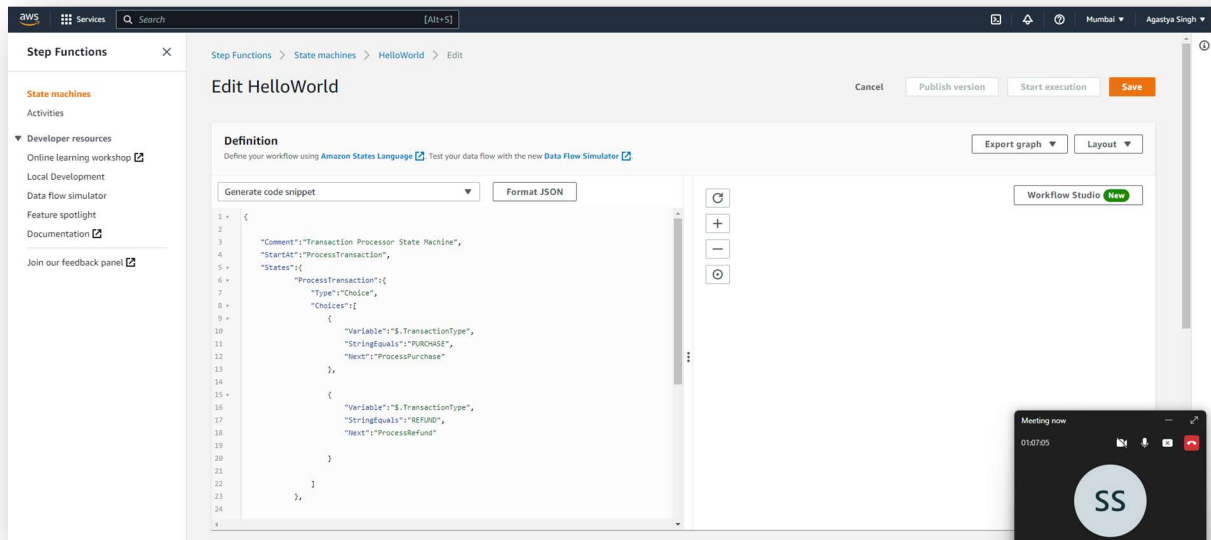

Purchase Lambda

1. Create another lambda function named Purchase.
2. Change its code as well, as mentioned in the file(purchaseProcess.py) and appendix below.

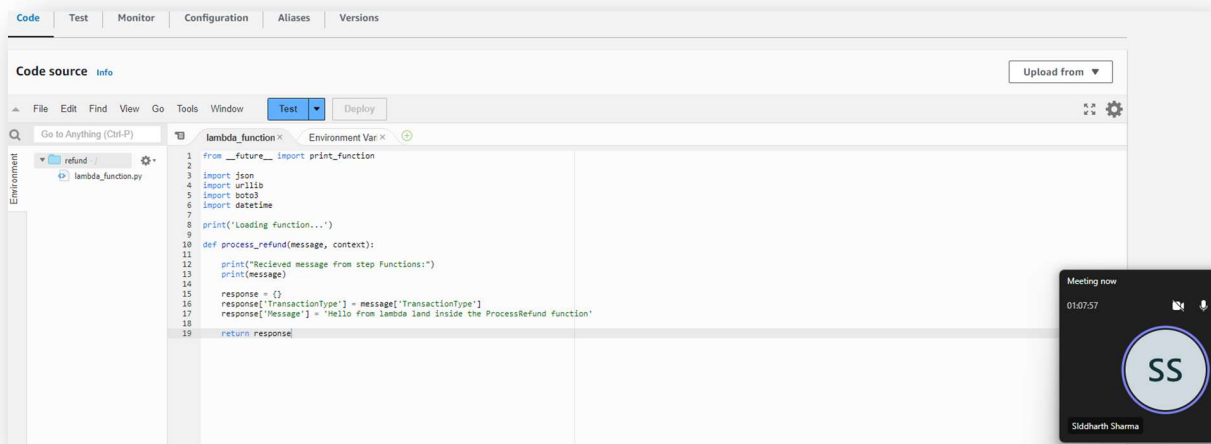

Step-Function

1. Now create an AWS Step Function and name it whatever you like, leave all the settings to default, and hit "create function".
2. Now go on Edit and change the code as given in the file and mentioned below in appendix as well.

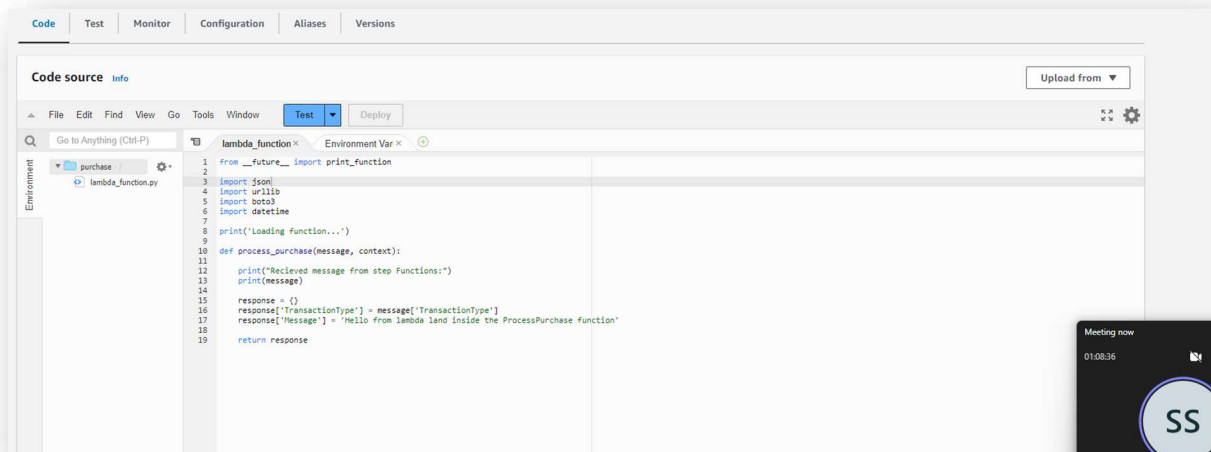

Refund-Json-code

1. Your code should look like as below:

Purchase-Json-code

1. And your purchase lambda code should look like this:

Runtime Settings

1. Now change the runtime settings of both purchase and refund lambda functions by clicking on Edit.
2. Change "lambda_handler" to its respective function name in the Python code as shown below:

aws Services Search [Alt+S]

Lambda > Functions > purchaseProcess > Edit runtime settings

Edit runtime settings

Runtime settings Info

Runtime
Choose the language to use to write your function. Note that the console code editor supports only Node.js, Python, and Ruby.

Python 3.7

New runtime available

A new runtime is available for your function's language: Python 3.10

Handler `.fo`

lambda_function

Architecture Info
Choose the instruction set architecture you want for your function code.

Start New Execution

1. Now start the “new execution” of the Step Function and change its Json code from “Comment” to “TransactionType”.

Start execution

Start an execution using the definition of the state machine. [Learn more](#)

Name - optional

060e73ee-30f8-496b-ad21-670cd57b4620

Input - optional
Enter input values for this execution in JSON format

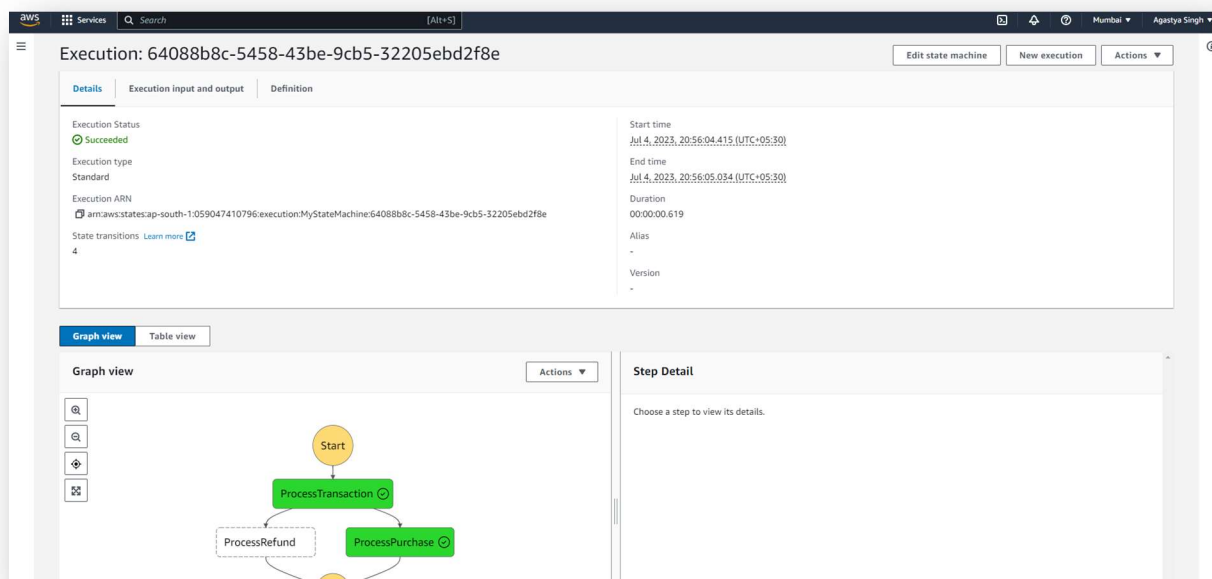

```
1 {  
2   "TransactionType": "PURCHASE"  
3 }
```

Start execution with latest revision

☐ Open in a new browser tab

Cancel Start execution

After Execution:

Appendix

PurchaseProcess.py

```
from __future__ import print_function
```

```
import json
```

```
import urllib
```

```
import boto3
import datetime

print('Loading function...')

def process_purchase(message, context):

    print("Recieved message from step Functions:")
    print(message)

    response = {}
    response['TransactionType'] = message['TransactionType']
    response['Message'] = 'Hello from lambda land inside the ProcessPurchase function'

    return response
```

RefundProcess.py

```
from __future__ import print_function

import json
import urllib
import boto3
import datetime

print('Loading function...')

def process_refund(message, context):

    print("Recieved message from step Functions:")
```

```
print(message)
```

```
response = {}
```

```
response['TransactionType'] = message['TransactionType']
```

```
response['Message'] = 'Hello from lambda land inside the ProcessRefund function'
```

```
return response
```
